## ABSTRACT

This report summarizes the findings and presents data from a nationwide survey conducted by the Texas Education Network (TENET) from July 25 to September 30, 1994. In response to a TENET questionnaire, representatives from 46 of the 50 states, Puerto Rico, and the U.S. Bureau of Indian Affairs reported on the status of telecommunications networks for K-12 public schools in their areas at the time of the survey. The report begins with an analysis of survey responses, and is followed by 52 state profiles describing computer telecommunications in the schools. Findings include: (1) by October 1, 1994, the majority of states had implemented or were preparing to implement public telecommunications networks, with 38% of respondents describing state networking efforts as "operational" or "partially operational"; (2) K-12 schools were just beginning to adopt telecommunications network technologies; (3) state officials recognized the need for telecommunications technology for education and had begun planning for it; (4) funding was the most daunting and problematic of 8 potential barriers to school networks; (5) lack of equity in public access to networked technology, lack of skilled personnel, widely scattered communities, and inadequate and outdated technology were identified as other obstacles to K-12 networks; (6) 19 states reported that funding for educational networks was available from local, district, state, and "other" sources; and (7) private sector support may influence public sector adoption of telecommunications. Appendices include state listings of public officials responsible for educational networking and major network and Internet service providers, and the TENET questionnaire. (Author/SWC)

**This report summarizes the findings and presents data from a nationwide survey conducted by the Texas Education Network (TENET) from July 25 to September 30, 1994. In response to a TENET questionnaire, representatives from 46 of the 50 states, Puerto Rico, and the U.S. Bureau of Indian Affairs reported on the status of telecommunications networks for K-12 public schools in their areas at the time of the survey.**

**T**

**This report begins** with an analysis of survey responses. There follow 52 state profiles describing computer telecommunications in the schools as reported by survey respondents. The report concludes with state listings of public officials responsible for educational networking as well as network and Internet service suppliers.

## **Findings**

- By October 1, 1994, the great majority of states had implemented or were preparing to implement public telecommunications networks. Thirty-eight (79%) of the respondents described networking efforts within their state as "operational" or "partially operational." Public information networks were slowly becoming a standard feature on the American landscape.
- \* K-12 schools were just beginning to adopt telecommunications network technologies when surveyed. Seventeen (35%) of the respondents listed Internet addresses for Gopher or Mosaic servers in K-12 schools or school systems in their states. While network technology had begun reaching K-12 schools, it had been deployed more commonly for other public services.
- \* States officials recognized the need for telecommunications technology for education and had begun planning for it. Forty-one of responding states had developed or were developing formal technology plans for school telecommunications networks when surveyed.
- \* Funding emerged as the most daunting and problematic of eight potential barriers to school networks. Fifty-six percent of the respondents rated *Funding* as a problem, creating a unique and striking consensus. Other barriers drawing strong ratings as problems were *Technical Infrastructure* (29%) and *Legislative Actions* (25%).
- \* Respondents voluntarily identified other obstacles to K-12 networks, including:
  - \* Lack of equity in public access to network technologies.
  - \* Lack of skilled personnel to deploy and service school networks.
  - \* Widely scattered communities that would be expensive to link with costly fiber networks.
  - \* Inadequate and outdated technology in local, rural telephone companies.
- \* Nineteen states reported funding for educational networks was available from local district, state, and "other" sources. States that maximized their funding opportunities were, predictably, less apt to rate *Funding* as a problem.
- \* Federal sources were the most frequently cited form of "other" funding for K-12 networks. Across the nation a wide variety of funding strategies were in use, such as specialized tariffs or tiered pricing. No one method predominated.
- \* A major service provider had established a program encouraging infrastructure development in 30 states. Private sector support may influence public sector adoption of telecommunications.

In the interval since this study was conducted as part of the State Networking Project, computer networking has continued to advance with astonishing rapidity. A recent QED (Quality Education Data) study revealed that, in the past year, use of computer networks in schools has grown by 64 percent. During 1994, Gopher traffic increased by 197 percent and use of the World Wide Web, by a staggering 1,713 percent, according to the Merit Network, a supplier of Internet services.

All of which spotlights the importance, if not the necessity, of linking public K-12 classrooms to the Internet and other computer telecommunications networks. Not only has technology evolved and connectivity increased, but the sheer quantity of valuable educational resources the networks can deliver has been compounded exponentially. Clearly, it is urgent that all American students get Internet tools placed into their hands.

But delivering those tools is a monumental task, as the State Networking Project demonstrates. It is true, survey data are accurate only for a specific and brief time period. The obvious facts reported here are temporal. Yet this drawback is overcome when one considers a more salient point: the problems facing public officials who assessed educational networks in their states are shared and persistent.

What problems are these? Infrastructure building. Regulatory actions. Most intimidating of all is the

problem of funding school networks. More than half of our respondents rated funding as a problem for state and local education agencies. And infrastructure development, regulatory environment, and, above all, funding are the unchanging issues underpinning the short-lived statistics gathered here.

Perhaps it's tempting to dismiss these observations as the usual complaint of educators: they always want more money and, seemingly, never have enough. But to do so would be a disservice not only to educators but to the first grade girl hungry to explore the lost world of dinosaurs on the Internet. The fourth grade class swapping observations on acid rain with counterparts in Central America. The farmboy studying Russian in a distance-learning classroom. These children and youths should be beneficiaries of burgeoning network resources. They will not be—until decisionmakers shape policies guaranteeing every student equal access to these educational tools.

Yes, it will be costly to link schools to flourishing information networks. But the evidence argues we may pay a greater price if we do not help children become literate users of technology. We hope the information here will shed light on the extent of this issue.

*Bringing the Internet to K-12 Schools*

*July 25-September 30, 1994*

Consider this document a snapshot of a moment in American education. The moment is July through September 1994. The subject of the photo is American public elementary and secondary schools—and their readiness and ability to use a powerful and increasingly influential tool: the National Information Infrastructure (NII), known popularly as the Internet or the information superhighway.

The report speaks directly to the challenge Vice President Al Gore issued to the National Education Association on April 8, 1994:

...it makes sense now to build networks of information superhighways that can convey large amounts of information and take them right to the classroom. Our administration has called upon the industries involved and set as a national goal the linking of every public classroom in America to this information superhighway by the turn of the century. We believe that it can be done. And there are many hopeful signs that it is now in the process of being done.<sup>1</sup>

But how close are America's school systems to achieving this goal? This report attempts to measure the distance between current achievements and future goals. It also attempts to map the emerging course of the information superhighway for public schools, kindergarten-to-twelfth grade. Finally, the report spotlights some potential obstacles that may block the development of the information highway as it reaches toward American educators and their students.

<sup>1</sup> Gore, Al. (1994, April). *Remarks by the Vice President to the National Education Association, National Education Association Convention Center, Albuquerque, NM, April 8, 1994*. Washington: The White House Office of the Press Secretary.

# Goals 2000 Reform

## I. Networks for

# Project Summary

Providing information superhighway links to every public school—much less each classroom—in the United States by the year 2000 is a visionary challenge. Helping to pave the way, the National Science Foundation, the U.S. Department of Commerce, and the U.S. Department of Education funded a task force led by The University of Texas at Austin Computation Center and the Texas Education Network (TENET). Calling itself the State Networking Project, the task force provided a meeting place for leaders with dual expertise in technology and education from all 50 states, the U.S. Bureau of Indian Affairs, and the Commonwealth of Puerto Rico.

TENET staff marshaled State Networking Project participants by requesting that each state department of education identify the staff person designated as responsible for telecommunications networking. This person in turn identified the network service provider(s) in their state. Representatives of federal, state, and local governments were identified as additional network partners as well. Task force members were asked to assess the status of telecommunications networking in their states' elementary and secondary schools—and to identify network implementation strategies guaranteeing equal access to these technologies for every public school pupil in the country. They shared their understanding and experience in on-line discussions, at a national workshop held in September 1994, and in a survey that described the status of educational telecommunications networks in their home state from late summer to early fall 1994.

Responses to this survey are recorded and synthesized here. The questionnaires were developed and distributed by TENET staff in late July 1994; respondents returned them no later than October 1. This report, therefore, describes the conditions of educational networks for a specific time period. Data appearing here were reported by task force members from 46 states, the Bureau of Indian Affairs, and Puerto Rico, unfortunately, responses from Delaware, Mississippi, Oklahoma, and Virginia became available too late to appear in the following comparative analysis of survey responses.<sup>1</sup>

The survey's 26 questions spanned five broad categories:

- Statistical and quantitative data specific to each state. What are the state's headcounts of teachers, students, campuses, and districts? What are student headcounts in the most and least populated districts? How many districts serve 1,000 or fewer students?
- The status of the state's telecommunications networking projects, with measures of that status. Are the state's networking efforts "operational," "partially operational," "planned," "proposed," or currently nonexistent? What depth and variety of state public information is available on-line? Do any community and freenet enterprises serve state residents, and do they cooperate with public education?
- The role of telecommunications networks in state plans. To what degree has telecommunications networking been incorporated, first, into the broader technology plans of the state and, second, into state plans for its public schools? Has a state Goals 2000 committee been appointed to promote school reform? Does it include a telecommunications representative?
- Funding of state telecommunications networks. How is the state paying for its telecommunications networks? What funding sources are available to schools specifically for network service deployment and services? Have any service providers established programs to encourage infrastructure building? Has the state utility commission ordered special tariffs for K-12 education? Beside state and local district monies, what funding sources are available to pay for educational networks?
- Barriers to telecommunications. How do states rate eight potential barriers to telecommunications networking? What hurdles unique to the state's geography and population distribution must be overcome before the Internet is accessible to every child attending its public schools? What other obstacles could delay or restrain each state in establishing universal educational networks?

Findings from these inquiries appear in the opening section of the report. Because funding emerged as the most pressing concern of survey respondents, a special section on funding barriers to educational networking precedes the general discussion of funding strategies.

The narrative analysis is followed by 52 *State Profiles* presenting survey responses or education demographic data from all 50 states, plus the Bureau of Indian Affairs and Puerto Rico. The *Appendices* contain the names and addresses of the individuals responsible for educational technology in the responding states and the TENET questionnaire.

<sup>1</sup> Data from all four states are included in the *State Profiles* elsewhere in the report.

# Data Analysis Methods

Comparing the responses to the five broad categories of information sought in the survey provides insight into exactly where the information highway is reaching America's schools, where the highway has been blocked, and which obstacles loom large. Please note, however, that this report seeks merely to highlight this information; it does not attempt to diagnose the difficulties or to advocate specific solutions for the barriers to networks identified by survey respondents. An effort has been made to treat each state's data objectively, and to present responses as accurately yet uniformly as possible. Survey responses were not second-guessed; no secondary sources were used to verify replies. Rather, every effort has been made to transcribe or analyze these data *as reported on the questionnaire by respondents.*

The prompts on the questionnaire themselves were designed to invite a variety of responses, from a simple "yes" or "no" to lengthy descriptions. And responses *did* range in length and complexity. While some participants answered every prompt tersely, many supplied detailed information when

appropriate. These ruminative replies are among the most provocative material collected here; where space permits, they appear verbatim in the *State Profiles*.

A similar range of responses occurred with requests for quantitative information: some participants responded with figures rounded in the thousands and other were precise to the single digit. It is assumed that respondents provided the most current numbers available and that the numbers apply to public K-12 school systems only. Likewise, headcounts of teachers are assumed to apply exclusively to full-time, permanent staff and "districts" to refer only to those with actively enrolled students. Nonetheless, enrollment figures should be read with a skeptical eye, for definitions vary widely from state to state. Louisiana, for example, could be reported as having 66 or 74 local education agencies, depending on whether vocational school districts are included along with the state's regular parish and city districts—a difference of 12 percent. Precisely accurate comparisons cannot be made in such diverse circumstances.

## Fall 1994.

# Networking Reaches K-12 Schools

 Based on survey responses, the goal of Internet connectivity by the year 2000 for every public K-12 classroom probably will not occur in any of the 46 reporting states, the Commonwealth of Puerto Rico, nor in schools managed by the Bureau of Indian Affairs. However, almost every state has begun to incorporate educational telecommunications in their broader technology plans and nearly 80 percent have deployed telecommunications networks carrying public information. Seventeen states reported that, at the time of the survey, a handful of their schools already had an established Internet presence with Gopher or Mosaic addresses for specific schools or school districts. Should use of the national information infrastructure (NII) continue growing at its present rate, by the year 2000 every state should be able to boast that at least some if not many of its K-12 teachers can include network-based activities in their lesson plans.

Only three respondents (from Maine, Vermont, and Puerto Rico) characterized their state as lacking network telecommunications. Six others described their networks as "planned" or "proposed."<sup>1</sup> In contrast, 38 states (79%) said their "state networking efforts" were "partially operational" or "operational."

While these self-descriptions may indicate the general sophistication of a state's network infrastructure, they were subject to broad interpretation by survey participants. A respondent from a state recognized as a pacesetter in educational networking described two discrete phases of its extensive and busy fiber optic network as "planned" and "proposed." The distinction between "operational" and "partially operational" networks (undefined on the questionnaire) seems to have been especially murky to other respondents, prompting some to interpret the terms very freely. One "operational" state noted its network offers e-mail services to state employees (and reported none other) while a state in a different region summarized its extensive menu of information services with the "partially operational" designation. Yet another state bestowed three separate status labels upon its three separate networking enterprises. Obviously, one state's networking ideal could be the first step for another.

Within the bounds of these caveats, nearly 80 percent of the surveyed states described their networks as "partially operational" or "operational." By October 1994 the lion's share of states had implemented or were preparing to implement public telecommunications networks.

Were there other, more precise measures of a state's networking attainments? Two were mentioned on the TENET questionnaire: the state's use of other information technologies and the range of information services it makes available on-line.

The most frequently reported technology was the state information network, which was in use in 29 of the states (60%). These intermediate systems were usually linked to interstate, national, and global networks on one hand and to community or site-specific local networks on the other. In many cases reported by survey respondents, the actual local internetwork link was made by server computers operating Gopher or Mosaic software. A majority of states reporting such networks also named or knew of specific K-12 schools that were operating a Gopher or Mosaic address on the Internet—with some anomalies. Maine, for example, reportedly lacked a state Gopher server and piggybacked its telecommunications services on the state university system.

Yet Maine reported that at least one public school within the state borders possessed a Gopher or Mosaic server delivering Internet access. But Maine is an exception. Speaking in the broadest of generalizations, it was far more typical that larger public institutions, such as state government, would first implement information networks. Only later would smaller public institutions, community libraries and K-12 schools among them, establish their own local area networks using on-site server technology.

When the survey was taken, K-12 schools were just beginning to enter this new world. One-third of the surveyed states (17) named at least one K-12 school maintaining an Internet presence via on-site Gopher or Mosaic servers. Both Arkansas and Utah, for example, listed Gopher or Mosaic addresses for two schools while New Mexico (at the top end) reported network nodes at 27 schools. Colorado noted school districts in Fort Collins and Boulder maintained Gopher or Mosaic servers that delivered network service to an

unspecified number of schools. New York mentioned that "a number" of intermediate educational units (BOCES) were establishing gateways to the World Wide Web, and Nebraska reported Internet addresses for 19 educational service units.

If the addresses provided on the surveys are reliable indicators, there are more high schools than middle or elementary schools that have Internet hookups and the benefits such technology affords. Seldom were elementary schools named as possessing Gopher or Mosaic addresses that directly connect students to the wealth of expertise and information available on the wide area networks of the Internet.

Such trends are not surprising. A 1993 study conducted by Princeton Survey Research Associates found that only 15 percent of teachers work in a "high-tech" environment offering:

computers in their classrooms (82%) and access to fax machines (69%) and modems (94%) at the school site....High-tech environments are most likely found at the senior high level, as well as in larger schools, suburban schools and in more affluent school districts.<sup>2</sup>

If the variety and depth of information services available on a network can chart the sophistication of a state's systems technologies, survey results reveal a very hopeful trend. More than 87 percent (42 of 48) of the respondents reported that their states provided electronic information about all or some combination of the legislature, public utility or public service commission, department of education, and "other" public organizations. Reporting no electronic information services when surveyed were Puerto Rico and five states: Connecticut, Idaho, Maine, New Hampshire, and Vermont.

Since the surveys were usually completed by employees of state education departments, it could be predicted that the most frequently listed information services were educational (36 states) followed by "other" services (30 states): often public library databases, e-mail services, newsgroups and bulletin board systems, or file transfer protocol (FTP) tools to download remote data files. Just under half of the states (22) electronically posted information

on their legislatures, while five reportedly provided data from their public utility commissions.

A significant majority of respondents reported that freenets or community data networks existed somewhere within their state borders: 37 states identified one to three community networks. Slightly more than half of these localized networks were described as collaborating to some degree with the state department of education.

States, communities, and their public schools were slowly adopting advanced telecommunications technologies. With 17 states reporting that at least one of their schools operated servers on-site to connect to the Internet, it seems some progress has been made since Honey and Henríquez' widely disseminated 1993 study of telecommunicating teachers:<sup>3</sup>

...use of the Internet is not yet a widespread or common practice among educators in the K-12 community; only half of our technologically sophisticated respondents [48%] report having access to the Internet,...In addition, our findings suggest that the Internet is serving as a more effective resource for professional development activities than it is for student learning activities.<sup>3</sup>

While it may be premature to call these findings obsolete, survey responses demonstrate quantifiable progress has been made in bringing the power of educational networking within the reach of American public school students.

<sup>1</sup> New Hampshire's self-described networking status was unclearly marked on the returned questionnaire.

<sup>2</sup> Princeton Survey Research Associates. (1992, June). *National Education Association Communications Survey: Report of the Findings*, p. 6. Princeton Survey Research Associates, Princeton, NJ. Author.

<sup>3</sup> Honey, Margaret and Andrés Henríquez. (1993). *Telecommunications and K-12 Educators: Findings from a National Survey*, pp. 30-31. New York: Center for Technology in Education, Bank Street College of Education. It should be noted that the Honey and Henríquez study is not strictly comparable to this one. In the former, classroom teachers were interviewed rather than the state officials surveyed here. The teachers reported on conditions in their schools instead of summarizing statewide conditions, as participants do here. Most respondents to the earlier survey were located in the northeastern United States, rather than coming from across the nation as here. Finally, the pool of Internet users and Internet tools has grown exponentially since 1991 and 1992, when Honey and Henríquez conducted their survey. Yet, as noted in the text, the Honey and Henríquez findings have been often quoted and provide a unique point of reference in discussions of K-12 adoption of Internet-based teaching.

# *Technology Plans in Educational Networks*

The prominence awarded to telecommunications networks in general technology plans can indicate how serious a commitment state government has made to regional implementation of the national information infrastructure. No sooner had federal Goals 2000 legislation passed in March 1994 than the Clinton administration began stumping for state K-12 educators to adopt networking tools. A new infusion of federal seed money became available to every state that incorporated educational networks in its broader technology plans.

Perhaps in response to federal patronage, by October 1994 a stunning majority of the surveyed states had embraced telecommunications networks—especially for their schools. They reportedly had built in computer telecommunications modules in one of two plans: in either their general state technology plans or in their plans specifically for K-12 schools.

In fact, 28 states (58%) reported having telecommunications components in either their statewide technology plans or in their technology plans for K-12 schools. Thirteen more (27%) were penciling in telecommunications networks for their statewide or K-12 technology plans when surveyed. The remaining seven reported that, as of October 1994, they had no plans for educational networking.

States tended to include educational networks in either their state plans or in their public schools plans. Only 15 states (31%) reported telecommunications components appear in both plans.

Among states formulating their telecommunications plans when surveyed, the great majority were more apt to plan networking functions for their schools or for their schools *and* state than for their state alone. In fact, eight of the 17 states claiming "in process" planning had specified networking exclusively for their schools, while seven were incorporating networking in both their state and school technology plans. A mere two states planned for educational telecommunications networks solely in their state technology plans.

Did incentives spun off from Goals 2000 legislation prod states into adding educational networking to their technology plans? Since the survey did

not ask exactly when the participating states began telecommunications planning, the causal relationship between passage of the federal measure in March 1994 and state-based network blueprints by the following September is nebulous.

Yet it's entirely possible that state-based Goals 2000 committees engendered by the legislation may serve important functions in the handful of states that otherwise lack plans for school telecommunications. Maine, Vermont, and Puerto Rico each reported a dearth of statewide technology planning, for example. Yet all three have appointed Goals 2000 committees, presumably enabling them to tackle technology planning among other educational reforms.

Actually, every one of the 11 states reporting no Goals 2000 committee at the time of the survey had incorporated telecommunications networking into their K-12 technology plans. It appears that, when these states planned network technology, they planned it first for schools.

There also appears to be a relationship between states that described their networking efforts as "operational" or "partially operational" and active technology planning. Technology plans alone cannot be credited with prompting states to initiate educational networking. Apparently in some states (California, Georgia, and Michigan among them), piecemeal public network deployment began before formal technology plans were written.

Yet nearly every state that was planning telecommunications networks for their schools, their state, or both also described their networking efforts as "operational" or "partially operational"; that is, 19 of 21 states with K-12 plans, 20 of 23 with state plans and 14 of 16 with plans for both K-12 and the state consistently gave themselves the highest technology development grades available on the questionnaires. The correlation is open to differing interpretations:

- o Specific plans for networking ensure the technology is adopted.
- o In those states where network technology has been implemented most successfully, it has almost always been planned.

Technology planning remains productive for states intent on educational reform. Between March and September 1994, 34 of the responding states (71%) had formed or were forming Goals 2000 committees—perhaps as evidence of their commitment to bettering their schools or perhaps as a strategem for obtaining more federal dollars. But it's obvious that, among educational reformers, a preferred means of improvement was planning and developing K-12 networks.

# Funding: The Dominant Barrier to K-12 Telecommunications

We've seen that by autumn 1994 most states were committed to establishing information networks for K-12 public schools. Most of the responding states had implemented telecommunications networks intended to serve the educational community along with other public organizations. Even in those states lacking established public telecommunications networks, officials had written technology plans pointing the way toward network-based schooling for their elementary and secondary students.

Yet barriers to telecommunications networks exist. And they may have forced otherwise supportive educators and state officials to postpone or restrain educational network plans. What were these potential barriers? Did they differ from state to state? Survey respondents rated several specific "potential barriers" on the questionnaire using a Likert Scale.

The questionnaire listed eight factors as "potential barriers...to your state's telecommunications networking efforts." These potential barriers were:

- A. Legislative and Regulatory Actions.
- B. Technical Infrastructure and Support.
- C. Professional Development and Training.
- D. Funding: Initial and Long-term.
- E. On-line Ethical and Liability Issues.
- F. Infusion into Goals 2000 and Educational Development.
- G. Developing Private Sector and Community Partners.
- H. Educational Systems and Policy Barriers.

A ninth, *Other: Please Specify* barrier concluded the list.

Respondents were asked to assign each potential barrier with a specific numerical rating on a scale from 1 to 5. These ratings were to delimit "the extent to which [each potential barrier] (1) is a problem or (5) is not a problem." The degree of difficulty decreased by steps from the most problematic Level 1 to the nonproblematic Level 5. Precise definitions of Levels 2, 3, and 4 did not appear on the questionnaire.

One respondent rated only five of the barriers, presumably in descending order from the most to the least problematic: *Funding, Infrastructure, Training, Developing Partners, and Systems-Policy*. The barrier ratings of four states (Georgia, New Mexico, Oregon, and Vermont) were provided by two respondents who occasionally gave differing ratings to specific barriers. Please see the *State Profiles* for these double ratings. Ten of the 48 states responded to the *Other: Please Specify* barrier, although very few gave numerical ratings to such responses.

If any single finding stands out in the survey, it is that a majority of states rated *Funding* as the most daunting barrier to educational networking.

Twenty-seven out of 48 respondents (56%) indicated that *Funding* is a Level 1 difficulty; i.e., *Funding* "is a problem" [See Graph D]. That half the states designated *Funding* as a Level 1 problem is not in itself remarkable; however, as Graphs A to H show, no other potential difficulty elicited such a unified, or extreme, response. Furthermore, this Level 1 rating should be viewed in comparison to the generally far lower ratings given to other potential barriers.

For example, while 27 respondents gave *Funding* a Level 1 difficulty rating, only eight chose the Level 2 rating, six each assigned it a Level 3 or 4 rating and only two gave it a Level 5 ("not a problem") difficulty rating.

Moreover, a higher number of respondents gave the *Funding* barrier a Level 1 rating than any other barrier and rating combination on the survey. The distinction becomes clear in Table 1, in which the survey's top five barrier-rating combinations are ranked by frequency.

The gulf between the *Funding* rating and those assigned to other barriers is dramatized by Table 1: 27 respondents agreed that *Funding* is a Level 1 difficulty. The second highest number of respondents to agree on a barrier/rating combination were the 18 who gave Level 3 ratings to the *Systems-Policy* barrier [Graph H]. Then come the groups of 16: 16 respondents selected the *Goals 2000* as a Level 3 difficulty [Graph F]; 16 the *Developing Partners* as a Level 3 [Graph G]; 16 each listed *Training* as a Level 2 and Level 3 [Graph C].

## The Five Most Frequently Selected Barrier/Rating Combinations

Barrier/ Rating	Frequency of Response	Percentage of Barrier
Funding/1	27	56.3%
Systems-Policy/3	18	37.5%
Goals 2000/3	16	33.3%
Training/2	16	33.3%
Training/3	16	33.3%

**Table 1**

There is also a connotation of weight or importance innate to the Likert Scale itself. In this survey, a barrier given a Level 1 difficulty rating would naturally be viewed as far more critical than a barrier with a relatively insubstantial Level 4 or almost nonexistent Level 5 difficulty rating.

Recognizing this implication, most survey respondents selected Level 1 difficulty ratings sparingly, thereby creating a sense of urgency whenever they appeared. Here again, the 27 states selecting Level 1 for the *Funding* barrier is exceptional, as Table 2 illustrates.

Note that 27 respondents (56.3%) gave Level 1 ratings to the *Funding* barrier [Graph D]. In contrast, 14 respondents (29%) selected Level 1 ratings for *Infrastructure*—the second largest group of respondents to rate a barrier as a Level 1 problem [Graph B]. The third most frequent occurrence of Level 1 ratings were the 12 respondents (25%) for *Legislative Actions* [Graph A]. And so it went as the groups grew smaller. It is worth noting that both the *Infrastructure* and *Legislative Actions* barriers are arguably pertinent if not intimately linked to funding issues.<sup>1</sup>

The scale itself also highlights the extraordinary nature of 27 participants choosing to rate a single barrier as a Level 1 difficulty. A Likert Scale invites moderation; respondents are typically reluctant to assign ratings at the extremes of 1 or 5. But while reticence was the apparent rule with other barrier ratings, 56.3 percent of survey respondents rated *Funding* at the most noticeable extreme of 1.

**Table 2**

And it was far more typical for respondents to designate barriers with difficulty ratings in the moderate Level 2, 3, or 4 range, creating the bell-shaped pattern seen clearly on Graphs C, E, F, G, and H. A glance at the eight graphs demonstrates typical versus extraordinary patterns. For instance, 18 states (37.5%) gave the *Systems-Policy* barrier a Level 3 difficulty rating—the most frequently selected difficulty designation for that barrier [Graph H]. Graphs C, E, F, and G demonstrate that similar frequency distribution patterns occurred with four other barriers:

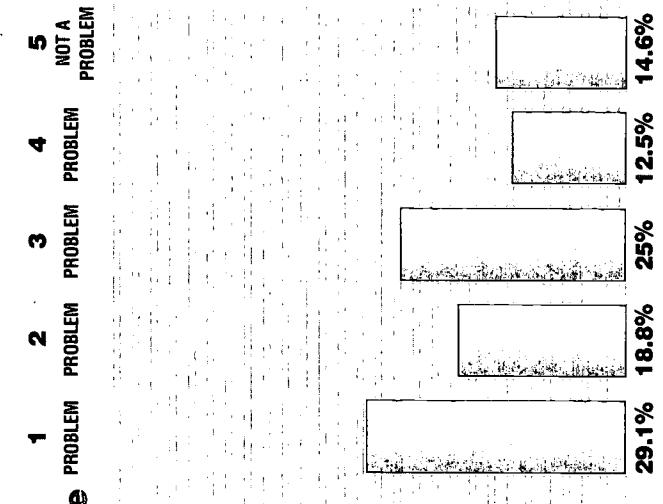

- *Training* (16 respondents, Level 2 and 16 respondents, Level 3).
- *Ethics/Liability* (15 respondents, Level 3).
- *Goals 2000* (16 respondents, Level 3).
- *Developing Partners* (16 respondents, Level 3).

It's plain that, as a barrier to K-12 networks, *Funding* is in a class by itself. And survey respondents had broadcast their extraordinary concerns with financing school networks in an equally extraordinary show of consensus.

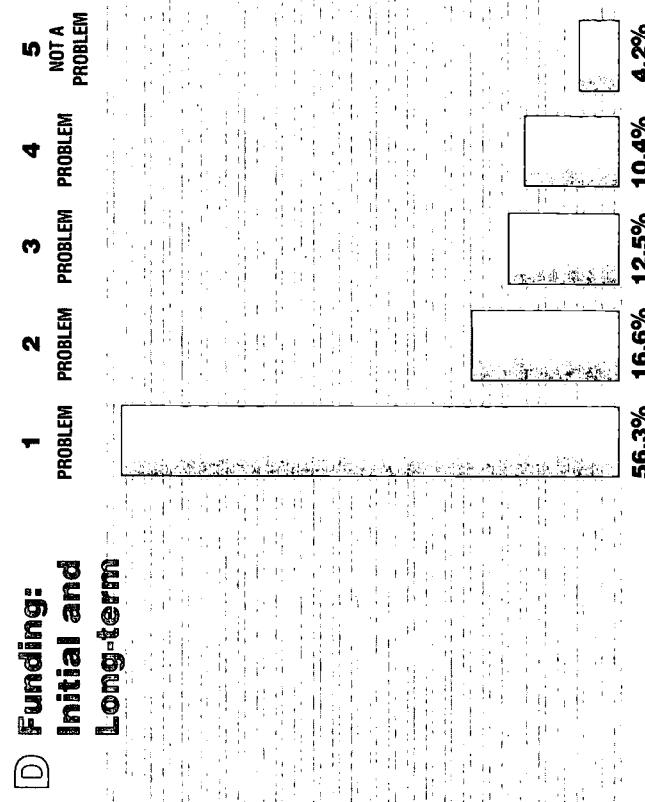

<sup>1</sup> It may be productive to remember that concerns related to *Training*, *Systems-Policy*, and *Ethics/Liability* do not usually surface until a functional system is up and running. Also, *Goals 2000* involves political considerations that may have colored participants' responses.

# Funding K-12 Networks: Sources, Strategies, and Concerns

**A** Level 1 difficulty rating by 56 percent of survey respondents indicated that financing educational networks worries officials from a meaningful number of states. Examining how states have paid for their K-12 networks may cast light on why financial concerns overshadowed the other barriers rated by survey participants.

What sources of funding have been available for educational networking: local district, state, or "other"? Nineteen of the states noted they considered all three (local district, state, or "other") as funding sources for networking projects. Another 19 states relied on two funding sources: 12 on local district and state funds while four sought local district and "other" funds and three sought state and "other" funds. Eight states, Puerto Rico, and the Bureau of Indian Affairs reported only a single source of funding available to them: either local district or state or "other."

Significantly, the greater the number of funding sources reported by a state, the less likely it was to list *Funding* as a Level 1 barrier in K-12 telecommunications implementation. States reporting only one source to fund their telecommunications efforts, not surprisingly, were also most likely to assign a Level 1 rating to *Funding*. It seems to have mattered little whether the single funding source was state, local district, or "other," although Alabama and Maryland, the two states reporting only local district funding, rated *Funding* as a Level 1 problem. Likewise with Arkansas, Maine, and Wyoming; all were reportedly dependent on the single "other" category of funds and all rated *Funding* as a Level 1 difficulty. Of the three states relying on state-only funding, Montana also gave *Funding* a Level 1 rating, slightly softening the correlation between the array of at-hand financial resources and heightened funding concerns.

States with two sources of funding tended to be less apt to report funding worries than those with only one—as would be expected. For instance, of the 12 states relying on local and state funding to develop educational telecommunications, five listed *Funding* as a Level 1 concern (Alaska, California, Illinois, Minnesota, and Vermont). On the other hand, Connecticut, Kansas, Louisiana, and South Dakota, the four states citing funding sources as local and "other,"

all gave *Funding* a Level 1 rating.

A significant number of states (25) were sharing resources with other educational networks—almost always from universities. This seemed to be indicative of the trend toward the development of partnerships between universities and primary/secondary school systems. It also appears to be a means for public schools to cultivate multiple funding sources. However, multiple funding resources were not a universal cure for schools systems coping with funding stresses. A third of the states listing *Funding* as a Level 1 barrier cited their funding as coming from local, state, and "other" sources—that is, a significant portion of states that had maximized funding sources nevertheless cited *Funding* as a Level 1 barrier to educational networking.

For all states—triple-, dual-, or single-funded—the "other" category might yield the greatest funding opportunities. A total of 31 states (64%) checked "other" as a source of funding for their educational networks. Eleven of the 31 declined to identify the "other" funding source. Eight of the remaining states listed private sector organizations as sources of telecommunications goods and services or direct funding for school networks. All of the remaining 12 states, however, named federal sources as the "other" or as one of their "other" funding sources; the dozen included the Bureau of Indian Affairs, a federal school system. Similar to Puerto Rico, some survey participants may have cited federal sources because their K-12 telecommunications networks had been funded primarily by the National Science Foundation, a sire of the American Internet. But more important than which agency was named is the fact that a quarter of the states seeking educational funding looked to Washington.

Where else did states reportedly seek funding? Among the "other" sources catalogued were corporate grants, gifts from philanthropic organizations, company donations of used computer equipment, partnerships with businesses. These included the ISDN deployment planned for a limited number of California schools by Pacific Bell Corporation. Georgia reported, under the "other" category, that state lottery receipts had been tagged for school networking. While awaiting legislative approval of annual operating funds

beginning the 1995-96 fiscal year, Arkansas drew a loan from its teachers' retirement system. North Dakota charged school users membership subscriptions, in the manner of Prodigy, CompuServe, and other commercial network service providers.

Only New York mentioned bond issues, a traditional means of capitalizing education. Nine states reported they had employed a relatively new funding strategy: their public utilities commissions had mandated specialized service tariffs for public school networks. In the case of Nebraska, the utility commission simply deregulated service rates, giving local districts the latitude to negotiate their own discounts. At the opposite end of the spectrum, Tennessee instituted tiered pricing based on the sophistication of the telecommunications services used. But the majority of government-dictated K-12 tariff programs called for schools to receive flat percentage savings on standard or commercial telecommunications usage rates. Texas schools, for example, benefit from a standardized 25 percent discount for any in-state telephone service used primarily for distance learning.

In a promising trend, nearly half of the nine states that instituted specialized tariffs for public school networking (Iowa, Nebraska, New Mexico, and Texas) also rated *Funding* as a barrier in the moderate 2, 3, or 4 difficulty range. Perhaps specialized tariffs for educational networks do alleviate funding pressures. At the time of the survey, four states, (Kansas, West Virginia, Vermont, and Utah) reported they were establishing special tariffs for education. Subsequent study of these states could better determine the impact of specialized service tariffs.

Communications service providers not only shape the cost of telecommunications networks; they are also key players in promoting information infrastructure development, according to one interpretation of survey results. Thirty states (62%) reported that a major service provider had begun a program to implement a statewide information infrastructure—and in most cases that supplier was a telephone company. Eight of these states reported the infrastructure was already partially available; 11 described the infrastructure as "in process"; and six said their infrastructure was in the planning stage.

In five of the 30 states, the precise level of infrastructure development was unclear.

As one would expect, the active promotion of infrastructure development by a service provider seems to have nudged some states into action. Twenty-six of the 30 states reporting such programs also described their networking efforts as "partially operational" or "operational." But like the correlation between technology plans and standing Goals 2000 committees, the status/infrastructure connection may be equivocal. There were insufficient survey data to determine how frequently provider promotion of networking led to implementation, if a causal link exists between the two at all.

To recap survey findings: states seemed to ease the financial burdens of educational networking when they:

- Maximized funding opportunities.
- Mandated user discounts for K-12 public schools.

Finally, states may tend to develop school networks sooner with the encouragement of telecommunications service providers.

State administrators have demonstrated their willingness to support telecommunications networks for public school students. Financing the undertaking is a problem many are yet to surmount.

# *Barriers to K-12 Telecommunications*

**W**hat other general trends can be identified in survey responses? There was surprising coherence in the obstacles volunteered by survey participants.

Thirty states reported barriers related to their regional locations and 39, obstacles related to population distribution. Because the actual obstacles identified by the states do not fit neatly in into the two tidy categories of "Regional Problems" and "Population Problems," it's best to identify specific problems uncovered in the surveys.

Alaska's respondent summarized obstacles at their extreme:

The bulk of Alaska's population resides in Anchorage, Fairbanks, and Juneau. The rest of the population is scattered across the state in small rural areas with limited access—most have no roads into the community. This results in technological haves and have-nots—most of the rural communities have no access to 56KB lines—the infrastructure just isn't there. Many of those rural communities have no cash-based economy—they are Native subsistence villages. Therefore, at this time, there is limited incentive for the telephone companies to invest in the infrastructure in these areas...when the traffic will not provide a return on that investment.

Variations on these themes resounded on many of the surveys.

For instance, many respondents described problems arising from populations split between crowded urban areas and their rural counterparts. In some states, urban school districts benefited from easier access to people with the technical expertise to deploy and administer educational networks. Colorado reported that a lack of such professionals creates problems in the more isolated areas of that state. A total of eight states—including the leaders in technological development, Texas, Hawaii, and Tennessee—explicitly pointed to a "lack of human infrastructure" as a barrier to educational networks.

Ten states reported that a significant percentage of their school populations is scattered or pocketed in remote locations; several others noted the "rural character" of their state creates difficulties in physically linking widely

dispersed campuses and school districts. Among these is South Dakota. Only a portion of South Dakotans profit from access to "a state backbone running from east to west in the center of the state, but the majority of schools are some distance from this line." As the Alaskan respondent noted, in such circumstances service providers have limited incentives to lay costly fiber networks that few people will use.

A total of 18 states identified barriers related to telephone service and telecommunications infrastructure—particularly in rural areas. Some members of this group judged the rural infrastructure as of poor quality or as simply inadequate to supply advanced telecommunications technologies to schools.

Others, including New Mexico, said all too frequently rural telecommunications service was provided by a crazy quilt of local "mom and pop" phone companies hampered by outmoded technology and a lack of current engineering expertise. Eight others had simply too many telephone companies serving state citizens. Minnesota distinguished itself in terms of sheer numbers: it reported that 93 phone companies serve its citizens. Obviously, it would be a challenge for state technology planners to induce so many competitors to cooperate in building a flexible, state-of-the-art public network infrastructure.

And a significant number of states reported a gulf between the school districts, often expressing this disparity with the phrase "equity issues," which appeared in the surveys of eight states. While it sometimes invoked urban versus rural concerns, the phrase had wider meaning.

For instance, Missouri linked "access and equity because of diversity." For the respondent from Illinois "equity" had to do first with quantity and demographic counts: "One-half of the student population is located in Chicago and its surrounding areas. Equity between urban and rural is an issue." Rhode Island echoed this sentiment: "Urban areas lack funds, human resources, and significant business partners."

But the barriers facing the majority of states were too idiosyncratic to be summarized here. Please see individual *State Profiles* for these data.

**POTENTIAL BARRIERS TO STATE NETWORKS** Networking issues or obstacles related to regional location

The topography and wide dispersion of population in the state in small remote villages makes it impossible to utilize land lines. Most communications in rural Alaska is via satellite.

*Continued in Additional Information*

The current infrastructure in small, remote villages precludes high-speed, reliable data transmission. In addition, because of that fact, intrastate rates are probably the highest in the nation. While other places, even rural areas of the nation, have the ability to lay fiber, there are some parts of Alaska that could never have fiber laid. New wireless technologies may hold some promise, but for the short-term the state will have to determine how to upgrade satellite-based technologies and who will pay for such an expensive venture. In addition, the rural areas may never see the benefits of competition, since we have a limited number of long distance providers and no competition in local telephone providers.

**Networking issues or obstacles related to population distribution**

The bulk of Alaska's population resides in Anchorage, Fairbanks, and Juneau. The rest of the population is scattered across the state in small rural areas with limited access—most have no roads into the community. This results in technological haves and have-nots—most of the rural communities have no access to 56KB lines—the infrastructure just isn't there. Many of those rural communities have no cash-based economy—they are Native subsistence villages. Therefore, at this time, there is limited incentive for the telephone companies to invest in the infrastructure in these areas...when the traffic will not provide a return on that investment.

**Other concerns about telecommunications**

In many ways, Alaska has the greatest needs for modern telecommunications, yet currently policymakers are not addressing this issue. Perhaps by the time Alaskans realize what they need and start making demands on the system, the window of opportunity offering to help subsidize the infrastructure through grants and other funding sources will be gone.

[As far as K-12 networks,] the Arkansas Public School Computer Network is the major service provider. Some individual schools are using commercial services like America Online or the post-secondary networks until their APSCN connection is in place.

We are working on several community LAN projects with cable TV providers and fiber LANs with telephone companies. We do not collaborate with any freenet organizations to my knowledge.

APSCN has a loan from the state teacher retirement system for development. An annual operating request using state funds has been submitted to the General Assembly beginning with the 1995-96 fiscal year.

APSCN and the Department of Computer Services have been working with Southwestern Bell on infrastructure development as part of a Public Service Commission overearnings stipulation.

POTENTIAL BARRIERS TO STATE NETWORKS	Networking issues or obstacles related to regional location
	None apparent.
<b>PROBLEM ▶</b>	<b>Population distribution</b> Connecticut has long been recognized as having two Connecticut's: the haves and the have-nots. Since schools are dependent upon the local community for technology, the opportunities for technology are directly tied to the local tax base. In the state, we are challenged with urban environments such as Hartford, Bridgeport, and New Haven, but we also must deal with rural low-income areas that cannot provide the technology resources needed for educational system.
<b>NOT A PROBLEM ▶</b>	<b>Other concerns about telecommunications</b> • National standards for student achievement—i.e., what should students be expected to know or be able to do after 12 years in high school with regard to telecommunications and technology? • In addition to the need for access to telecommunications (a statewide network, building distribution, etc.), schools must be able to provide computers and other related hardware if students are to effectively make use of the information superhighway. Where will the support (\$\$) come from? • Will the Internet (or future information highway) be able to support the anticipated increased use by schools? How will the Internet be able to handle the increased access requests? • What will be the impact on schools as a result of deregulation of the telecommunications industry? • Professional development programs and teacher preparatory programs need to provide more training in using technology.

<b>g. Developing Private Sector and Community Partners</b>	[REDACTED]
<b>h. Educational Systems and Policy Barriers</b>	[REDACTED]

Identified but did not rate several additional Potential Barriers to State Networks

- Lack of local technology support personnel in school districts.
- Building wiring. Distribution within schools does not permit easy access to telecommunications throughout school buildings. The typical number of phone lines in an average school building is four to six, which does not permit access to telecommunications for classroom use.
- Lack of categorical funding for technology and, specifically, telecommunications.
- Local school districts not required to use state funds for any technology.
- Lack of technology standards for school construction/renovation. This issue is currently being addressed by a state-level committee on ed tech standards.
- Awareness level and support by local school administrators; e.g., superintendents, principals, board of education members, parents.

There are two types of agencies that offer support to education:

- 1) Regional Educational Service Centers with six throughout the state.
- 2) Cooperative Library Service Units with four throughout the state to support educational library services.

Both receive some state funding but are operated by independent boards.

\* Two respondents from Georgia completed surveys. Their responses to questions have been combined and their barrier ratings are marked A and B.

POTENTIAL BARRIERS TO STATE NETWORKS

Networking issues or obstacles related to regional location

The telephone companies do not have digital transport facilities at many of the rural locations and they have not offered to backhaul the data at a reasonable cost. This can work a hardship on the smaller rural school districts that most need the help from technology.

  - h.** Educational Systems and Policy Barriers

Networking issues or obstacles related to population distribution

The people who are keeping pace with the rapid changes in technology are located in the population centers of the state. This means that the required support people are not always available in the portions of the state that would most benefit by the infusion of technology.

**Other concerns about telecommunications**  
Ongoing cost and its acceptance by school sites.

The Board of Regents for the University System and Department of Administrative Services both have extensive connectivity. The DOAS is developing and implementing an expansion of their existing SNA network to add the TCP/IP protocols and add connections to all state agencies. This activity is coordinated with and in cooperation with the University System and PeachNet's activities for education. The two networks are currently interoperable. Many of the colleges and universities have Gopher and Mosaic servers.

- I have three major concerns about telecommunications technology.
    - With immediate impending improvements in communications technology, will people be able to adjust to the infusion of new ideas into their lives and activities? For example, relatively sheltered rural communities will suddenly have access to other religious, political, and sexual views (to name three hot areas in the South). I am afraid the adjustment will be difficult.
    - Can the education system find a way to pay for the bandwidth that will be required to make significant improvements in education in rural areas? The present tax system seems unsuited for the task.
    - Can the 35 local telephone companies in the state along with cable companies, long distance carriers, and other providers cooperate in constructing the facilities education will need at a cost education can afford, or will it fall to the state to create the infrastructure with public funds?

# Hawaii

S T A T E F A C T S		Status of State Networks		Network Development		Technology Plans		Funding for Educational Networks

		There is Hawaii FYI, a public information provider. There is some collaboration with the Hawaii FYI and the Department of Education to provide information service to the schools.							
		They collaborate with the State Department of Education							

**POTENTIAL BARRIERS TO STATE NETWORKS****Networking issues or obstacles related to regional location**

There is a limited number of network service providers in Hawaii; therefore, the low competition in network services tends to keep the telecommunications costs fairly expensive. Working and coordinating with several different telecommunication providers for installation of the Institutional Network has been challenging. Availability of some of the advanced network technologies from the major network providers in Hawaii sometimes lags.

**PROBLEM ▼**

We have one school district. The State Department of Education is the school district for public schools in the state of Hawaii.

We have a statewide, protocol-independent, wide area data network that connects all schools and offices in the state to the computer hosts.

The state has embarked on building the Institutional Network (I-Net) primarily from the agreement on cable TV franchises. The I-Net will be based on SONET and other fiber optic network and Ethernet over CATV technology. Our goal is to connect all schools to the I-Net. GTE Hawaiian Tel has started implementing a so-called "worldclass network" that will provide frame relay service, SMDS, ATM service, and some video applications.

**Networking issues or obstacles related to population distribution**

Some schools in the remote rural areas of the neighbor islands, such as the islands of Molokai, Hawaii, and Maui, are not served by the major telecommunications providers for high-speed digital networks.

The Iowa Telecommunications and Technology Commission (ITTC) was established during the 1994 Iowa legislative session. This three-member commission supervises the management, development, and operation of the state's fiber optic network, the Iowa Communications Network (ICN). The ITTC has the authority to set fees for the ICN. Currently, educational video rates are \$5 per hour per site. Information on the rates is not available electronically.

In 1989, Governor Terry Branstad proposed, and Iowa lawmakers adopted, legislation that would create the Iowa Communications Network (ICN). The ICN is a statewide, two-way, full-motion, interactive, fiber optic telecommunications system.

Construction began in 1991 on the backbone of the ICN, which connected distance education classrooms in each of Iowa's 99 counties as well as the three public universities and Iowa Public Television. These original 103 sites were located at 52 public school districts, 43 sites in Iowa's 15 merged area community college regions, two of the 15 Area Education Agencies (AEA), and two independent colleges. Transmission of classes over the ICN began in August 1993. During the 1993-94 school year, approximately 20 independent colleges and universities initiated plans to connect to the ICN. Additionally, a Request For Proposals (RFP) was released in August 1994 to begin the process of adding about 500 more sites to the ICN, thereby connecting every school district within the state, the remaining AEAs, and selected public libraries.

No one within the Iowa Department of Education has responsibility for K-12 computer networking. Educational applications on the state's fiber optic network are coordinated by Iowa Public Television.

**POTENTIAL BARRIERS TO STATE NETWORKS** Networking issues or obstacles related to regional location  
Kansas is 82,000 square miles.

**Networking issues or obstacles related to population distribution**

Most of the population of Kansas is situated in the eastern part of the state. There is a number of rural school districts where the distances are great.

◀ **NOT A PROBLEM**

- a. Legislative and Regulatory Actions

- b. Technical Infrastructure and Support

- c. Professional Development and Training

- d. Funding: Initial and Long-term

- e. On-line Ethical and Liability Issues

- f. Infusion into Goals 2000 and Educational Development

- g. Developing Private Sector and Community Partners

- h. Educational Systems and Policy Barriers

The Information Network of Kansas (INK) was created by the 1990 Legislature to provide electronic access of public information to Kansas businesses and citizens on an on-line computer network. INK provides legislative, bank, legal, insurance, business and commercial, library, state-agency, local government, and children's information services. A special section of INK, the Kansas Education Network, is dedicated to the support of public education. It provides educators and students electronic access to INK's many information services, plus a continually growing list of educational applications,...INK also provides e-mail and Internet access.

As a result of recent legislation, Southwestern Bell will be constructing a statewide fiber-based distance learning network. This network will initially provide on-request, two-way interactive video for schools in its service areas. Data communications on these networks will also be possible.

The Kansas Research and Education Network (KANREN) provides direct Internet access through a regional provider for its member educational institutions. Current members include four-year and community colleges. Future expansion of KANREN will include public schools and libraries.

Number of districts that have fewer than 1,000 students

### Technology Plans

Long-range planning for telecommunications incorporated into state technology plans  
A state telecommunications plan is being developed.  
K-12 education has not participated in the development of the state telecommunications plan.

**No**

### Partially Operational

Long-range planning for telecommunications incorporated into state K-12 plans  
State plans for K-12 education have not included telecommunications.

**Yes**

### Proposed

Goals 2000 planning committee established  
Telecommunications contact None.

**No**

### Planned

Intermediate educational units are available to assist schools with training for telecommunications implementation  
Louisiana has regional service centers for K-12 education. Planning, staffing, and funding would be needed for those centers to play a significant role in telecommunications training or implementation.

**No**

### Operational

State Gopher server or Mosaic home page address  
Not for K-12 education.  
SDE has participated in a state grant proposal to develop information servers across 13 Louisiana governmental agencies, including the legislative and judicial branches.

*See Additional Information*

K-12 Gopher server or Mosaic home page address  
Not to our knowledge.

### Funding for Educational Networks

Funding sources available  
**Local District**  
State  
Other  
*See Additional Information*

Special telecommunications tariffs for education established by the Public Utility Commission/Public Service Commission  
A 67 percent price reduction for schools and libraries for a distance-insensitive flatrate of \$110 per month for 56KBps lines and \$358 per month for T1 lines, one line per location.

A major telecommunications provider has a program encouraging infrastructure development in the state

BellSouth says statewide support for ISDN access is underway. Also discussing possible demand for ATM switches.

POTENTIAL BARRIERS TO STATE NETWORKS	Networking issues or obstacles related to regional location
▼ PROBLEM	Community networks or freenets established in state Freenet efforts are underway in several Louisiana cities. Collaboration is not active with the SDE at this time.
▲ NOT A PROBLEM	<p><b>Population distribution</b> Louisiana's population is concentrated in the southern areas of the state. Rural, suburban, and urban areas have their local issues.</p> <p><b>Other concerns about telecommunications</b> Network access for education is inhibited by our knowledge of (comfort with) networking technologies. The rapid changes in network technologies add to the anxiety of making decisions. Educators express concerns that they are "at the mercy" of technology vendors. Clearinghouses for networking and technology approaches that work in education could assist decisionmakers.</p> <p>Education plans for networking must integrate administrative and instructional applications. Education cannot afford to build and maintain separate networks.</p> <p>Telecommunications and technology funding opportunities in Louisiana have been primarily isolated, one-time projects with short-term impact. Local plans, reinforced by a statewide plan, could provide an improved framework for sustained and focused progress.</p> <p><b>For further information, contact</b> Barbara H. Andrepon, Director Louisiana Department of Education Bureau of Management Information Systems 3455 Florida Blvd. Baton Rouge, LA 70806 BAndrepon%ED@mail.doe.state.la.us (504) 342-0091 Fax (504) 342-1912</p>

Community networks or freenets established in state

Yes

There are currently two freenet efforts in the state. One is in Omaha, the other in Lincoln. Both were supported by the Department of Education.

They collaborate with the State Department of Education

Yes

Identified and rated additional Potential

Barriers to State Networks

Technical complexity of the task. Political structure (climate) to allow for cooperation

2

Schools access the Internet at nodes located in the 19 Educational Service Units. Six nodes have Gopher servers and two have Mosaic home pages. The node at the Department of Education will have Mosaic soon. Internet address of those having Mosaic pages:

nde4.nde.state.ne.us  
ips.esu18.k12.ne.us  
esu3.esu3.k12.ne.us

Nodes having Gopher servers are:

nde4.nde.state.ne.us.  
esu6.esu6.k12.ne.us  
genie.esu10.k12.ne.us  
panesu.esu14.k12.ne.us  
esu16.esu16.k12.ne.us

These last five and the esu3.esu.k12.ne.us server are located at Nebraska's 19 Educational Service Units. Internet addresses for other ESUs are:

mother.esu1.k12.ne.us  
esu2.esu2.k12.ne.us  
gilligan.esu7.k12.ne.us  
pluggers.esu8.k12.ne.us  
esu9.esu9.k12.ne.us  
courier.esu11.k12.ne.us

Local autonomy of districts

New Mexico Technet, Inc. is a self-supporting, private, nonprofit corporation operating throughout New Mexico and on the Navajo Reservation in Utah, Arizona, and Colorado. It provides the management of a statewide fiber optic computer network serving the State of New Mexico, the state universities, and statewide research, educational, and economic-development interests.

Technet provides free Internet access to all public and private K-12 schools in New Mexico via free dial-in accounts (including 800 number access) on our VAX computers. Technet has established nodes throughout the state, including those at 27 high schools. Many smaller, two-year, and vocational post-secondary institutions also use Technet dial-in accounts for their Internet access.

Among the activities supported by Technet are: *The New Mexico Super-Computer Challenge*. Over 160 teams of New Mexico high school students (over 700 students and teachers) compete for scholarships and computer equipment for their schools by designing and completing projects using supercomputers at the various national laboratories located in New Mexico.

*NEDCOMM, the New Mexico Educators Communication Network*. New Mexico primary and secondary schools are provided with modem access to guidance and consulting databases, college course directories at the state universities, school administration information, teacher availability databases, bulletin board systems, USENET News, etc.

Technet was originally created by the State of New Mexico, the three state research universities, and the national laboratories and research organizations.

POTENTIAL BARRIERS TO STATE NETWORKS

## Networking issues or obstacles related to regional location

Technical ability is readily available; the problem is reasonable cost for providing services and the related funding issues.

W

W

W

Networking issues or obstacles related to population distribution

The greatest obstacle with population distribution is the lack of affordable telecommunications facilities that can provide access to all citizens, educational institutions, etc., within the state. The state's goal is to provide affordable access to all citizens, not just those in urban areas.

They collaborate with the State Department  
of Education

There is no formal collaboration

South Carolina has a large, statewide, shared-backbone network consisting of multiple T1s and digital cross-connect devices. The network provides backbone facilities for the agencies having statewide needs and also provides facilities for the state's long distance voice system. The Office of Information Resources (OIR) has recently implemented a Columbia Metropolitan Area Network or

MetroNet. The MetroNet will permit state government agencies in Columbia to connect their local area networks at various sites and will provide transport for intergovernmental electronic messaging, document transfer/sharing, and access to the Internet. A contract has been negotiated giving state government T1 access to the Internet with SunBelt.Net in Rock Hill. OIR is planning to expand the multiprotocol network throughout the state. Cisco routers in the Greenville, Charleston, and Florence will be connected by T1 data circuits to the MetroNet.

The state is designing a statewide dial-up network to meet a growing need for low-cost information transfer to locations not served by dedicated or direct-connect data services. One immediate need is dial-up Internet access for the state's K-12 community. The goal is to provide local access at a fixed rate.

The state also has a statewide multichannel Educational Television System using ITFS technology to serve K-12 and higher educational institutions. The system is served by state-owned microwave, but recently has begun to use satellite transmission. The use of compressed video is being explored for video conferencing and distance learning.

**POTENTIAL BARRIERS TO STATE NETWORKS**

**Networking issues or obstacles related to regional location**  
 South Dakota's small population and the fact that a large number of schools are in extremely rural locations make access of any kind expensive.  
*See Additional Information.*

**Networking issues or obstacles related to population distribution**  
**A PROBLEM ▶**

The state's small population and large land areas means that commercial vendors probably will not find South Dakota profitable to serve at affordable rates.

**Other concerns about telecommunications**  
**NOT A PROBLEM ▶**

- South Dakota has more than 32 independent telephone companies, thus complicating statewide networking.

- School budgets as well as state government are at risk of large budget cuts this year, which further lessens the likelihood of state funding for telecommunications.

- Historically, higher education and K-12 have not collaborated extensively. The collaborations are necessary to build a strong telecommunications infrastructure.

- The lack of a comprehensive state plan for telecommunications means that the systems are being developed in parallel, rather than collaboratively.

The responsibility for K-12 networking is not placed within the state Department of Education, but at Technology and Innovations in Education (TIE), a nonprofit that often functions as an extension of the South Dakota Department of Education and Cultural Affairs.

TIE provides leadership and assistance to schools regarding technology applications and school restructuring. TIE services are available to all interested schools and include RDE (the K-12 network), the TIE newsletter, TIE's annual conference featuring new technology, technology training and technical assistance to schools, and the TIE Preview Center, which offers software and videotdisk products for review.

Commercial vendors offer [WAN network] points-of-presence in only three populations centers. The point-of-presence of the state's NSF vendor MID-NET is in the extreme southeast corner of the state. There is a state backbone running from east to west in the center of the state, but the majority of schools are some distance from this line. For example, TIE pays \$300 per month for a 56KB line, plus the yearly membership fee to MIDNET of \$4600. Hookup time has been extremely slow.

Six other Internet nodes exist in the state. Five are at higher educational institutions, but there is little access allowed yet for K-12 schools. A major NSF Connections grant was written in 1992, and it is planned to bring up 23 new nodes but to date those connections are not in place.

Public Utility Commission/  
Public Service Commission

State Department of  
Education

Other

*See Additional Information.*

State Gopher server or  
Mosaic home page address

Not explicitly set up by the  
Tennessee Education  
Network (TEN).

K-12 Gopher server or  
Mosaic home page address  
Reference previous  
answer.

Community networks or  
freeneis established in state

They collaborate with the State  
Department of Education  
To the extent that we all  
know about each other.

#### Operational

#### Partially Operational

#### Technology Plans

Long-range planning for telecommunications incorporated into state technology plans  
At the state telecom organization level to meet the needs for state government operations as a telecom user, yes; at the Governor's level to incorporate economic development strategies, in process.

Long-range planning for telecommunications incorporated into state K-12 plans  
Yes, although we're still working on it, realistically.

Goals 2000 planning committee established

Intermediate educational units are available to assist schools with training for telecommunications implementation  
Training centers run by the State Department of Education and higher ed.

#### Planned

#### Proposed

#### No Current Plans

#### Funding for Educational Networks

Funding sources available  
Local District

State

Other  
Private/philanthropic resources garnered by districts plus some broad-based creative partnership efforts, such as Vanderbilt University/Chamber of Commerce/State Purchasing collaborative to locate, refurbish, and deliver used PCs from the private sector to teachers.

Special telecommunications tariffs for education

established by the Public Utility Commission/Public Service Commission

There is one for phone lines to schools for use in dialing into databases (Internet), one for phone lines in schools for voice processing/voicemail services, and one for T1 for video.

**POTENTIAL BARRIERS TO STATE NETWORKS\***

Networking issues or obstacles related to regional location  
N/A.

\* The single respondent who completed the Tennessee survey noted, "Responses are personal and don't necessarily reflect the views of all state folks involved; I did not take a poll of opinions."

**PROBLEM****POTENTIAL BARRIERS TO STATE NETWORKS\***

A major telecommunications provider has a program encouraging infrastructure development in the state  
**Yes**

Reference the PSC's FYI Tennessee program begun in 1990: There's one for phone lines to schools for use in dialing into databases (Internet), one for phone lines in schools for voice processing/voice-mail services, and one for T1 for video.

**Identified another Potential Barrier to State Networks**

Biggest problem, one I do not put under either Technical Infrastructure or Training, is lack of human infrastructure to support networking design, implementation, and operation—especially at the local level (LAN administrators, etc.)

TEN, Tennessee Education Network, is a state Department of Education/K-12 initiative. It is being conceived and implemented in the broader context of state government networking, working with those responsible for managing those networks in the Office for Information Resources. I find the use of the term "state network" unclear—whether it means the state K-12 network or *all* state government networking. We're trying to keep it all in sync in Tennessee.

The state's computer networking efforts are in first phase (dial-in) this summer, so considerable growth and change is in store for the network in this year.

POTENTIAL BARRIERS TO STATE NETWORKS	Networking issues or obstacles related to regional location
	Utah has insufficient clout to impact national policy.
	<b>Networking issues or obstacles related to population distribution</b>
	One of Utah's greatest challenges with networking deals with the rural nature of the state. Fiber services will be a long time coming and prohibitively expensive in some of our more rural areas.
► PROBLEM	
▼ NOT A PROBLEM	
a. Legislative and Regulatory Actions	
b. Technical Infrastructure and Support	
c. Professional Development and Training	
d. Funding: Initial and Long-term	
e. On-line Ethical and Liability Issues	
f. Infusion into Goals 2000 and Educational Development	
g. Developing Private Sector and Community Partners	
h. Educational Systems and Policy Barriers	

**State and K-12 Technology Plans Technology 2000** is a broad, multifaceted initiative designed to propel Utah to leadership in the development and application of advanced information technology for state government, public and higher education, citizens, and private businesses.

Utah has been aggressive in building a statewide infrastructure to improve student achievement through integration of technology into the teaching and learning process. Existing legislation is in place that allows all schools and school districts to participate. Governing committees represent state government, public and higher education, local school districts, business and industry, and parents. The infrastructure has been built under the guidance of two entities: the Educational Technology Initiative, providing school and classroom computers and related technology, and the Utah Education Network, responsible for building a statewide telecommunications network.

US WEST has been an aggressive partner in building our state infrastructure. In addition, the independent telephone companies are also upgrading to fiber as quickly as possible.

**Community Networks** Some private companies offer Internet access for a price; however, we do not know of any collaborations with the state. The State Information Technology department started to offer free Internet access through the toll free state phone line, but retracted that access when it received the first \$17,000 phone bill.

**Funding Sources** Local District: technology initiative and local funds. State: \$5 million (K-12) appropriated for the year beginning July 1. Other: US WEST has secured corporate funds for deploying fiber.

## *Questionnaire for the State Networking Project*

**The following information will help us insure that this project addresses the issues most relevant to you. Please answer the following questions and return them to us by fax or e-mail no later than September 30, 1994.**

1. Who are the members of your state's Goals 2000 planning committee? Please identify the telecommunications person on that team.
2. How many school districts are in your state?
3. How many school buildings are in your state?
4. What is the number of K-12 teachers?
5. What is the number of K-12 students?
6. How many students are in the largest district? ("Largest" refers to student population.)
7. How many students are in the smallest district? ("Smallest" refers to student population.)
8. How many districts have fewer than 1,000 students?
9. What is the current status of your state's computer networking efforts?
  - a. Operational
  - b. Partially Operational
  - c. Planned
  - d. Proposed
  - e. No Current Plans
10. Which information services are provided by your state network? (Indicate all that apply.)
  - a. Legislative
  - b. Public Utilities Commission/Public Service Commission
  - c. State Department of Education
  - d. Other (Please specify)
11. Does your state currently have a Gopher server or Mosaic home page? If so, what is the Internet address?
12. Do any schools in your state currently have a Gopher server or Mosaic home page? If so, what is the Internet address?
13. Are there community or freenet telecommunications efforts in your state? Does this network collaborate with your State Department of Education?
14. Has a major telecommunications provider established a program in your state to encourage infrastructure building within the state? If so, please explain.
15. Has your state Public Utilities Commission/Public Service Commission established special telecommunications tariffs for education? Is the tariff information available electronically? Where? Please summarize the tariff.
16. Has a long-range plan for telecommunications been incorporated into your state's plans for K-12 education?
17. Has a long-range plan for telecommunications been incorporated into plans for your state at large?

278

**18.** Are intermediate educational units (e.g., regional education service centers, BOCES, etc.) available in your state to assist you with training related to telecommunications implementation?

If so, please describe.

**Each participant, please respond to the barrier questions.**

**23.** Please rate each potential barrier independently in terms of the extent to which it (1) is a problem or (5) is not a problem for your state's telecommunications networking efforts.

- a.** Legislative and Regulatory Actions      **1** **2** **3** **4** **5**
- b.** Technical Infrastructure and Support      **1** **2** **3** **4** **5**
- c.** Professional Development and Training      **1** **2** **3** **4** **5**
- d.** Funding: Initial and Long-term      **1** **2** **3** **4** **5**
- e.** On-line Ethical and Liability Issues      **1** **2** **3** **4** **5**
- f.** Infusion into Goals 2000 and Educational Development      **1** **2** **3** **4** **5**
- g.** Developing Private Sector and Community Partners      **1** **2** **3** **4** **5**
- h.** Educational Systems and Policy Barriers      **1** **2** **3** **4** **5**
- i.** Other (Please specify)

**20.** Who is the person responsible for setting up or directing the computer network for K-12 in your state department of education?

Contact Name:

Organization Name:

Mailing Address:

E-mail Address:

Phone Number:

Fax Number:

**21.** Who are the major network service providers for K-12 education in your state?

Contact Name:

Organization Name:
